

NFT BRIDGES

NFT Bridges Litepaper

V 4.1

nftbridges.xyz

INTRODUCTION

NFT Bridges is building the most secure, creator-authorized infrastructure for cross-chain NFT transfers. Using Chainlink CCIP and the CCT standard, we enable NFT collections and users to move assets natively across chains while preserving ownership, metadata, and collection identity.

Our native token, Teleport (\$TLPT), is designed as a multi-chain utility token deployed using Chainlink's Cross-Chain Token standard. It powers the protocol's payments, governance, staking, and incentivization.

NFT Bridges is not just a bridge. It is the liquidity layer for NFTs across Web3.

THE PROBLEM

NFTs are siloed by chain. Their creators and collectors are often locked into isolated ecosystems, preventing access to liquidity, broader audiences, or utility across other platforms.

This fragmentation leads to:

- Low liquidity and floor prices
- Complex user experiences when trying to move NFTs cross-chain
- Risky, non-standard bridging solutions that compromise provenance

While billions of dollars of fungible tokens flow cross-chain each year, NFTs remain geographically trapped.

THE SOLUTION

NFT Bridges offers a secure lock-and-mint architecture governed by a registry of verified collections and creator permissions. Our protocol ensures NFTs:

- Move safely across chains without duplication
- Maintain metadata and provenance
- Can be locked, minted, and moved back to the original chain if necessary

This system is powered by Chainlink CCIP for cross-chain message security and is supported by a DAO-driven governance and incentive model. 1

MARKET OPPORTUNITY & COMPETITIVE LANDSCAPE

The NFT sector continues to expand across chains, with over \$40B in NFT trading volume recorded since 2021. Yet the majority of these assets are trapped in their original chains.

New L1s and L2s are launching NFT markets (e.g., Soneium, Astar), and legacy collections are looking to expand their reach. The opportunity to become the default NFT bridge infrastructure—especially with Chainlink backing—is wide open.

NFT Bridges is uniquely positioned to become the standard NFT settlement layer for cross-chain liquidity, marketplace interoperability, and protocol-to-protocol NFT finance.

BRIDGE-AS-AN-IFRAME: PLUG-AND-PLAY INTEGRATION

NFT Bridges has developed a lightweight, embeddable bridge widget in the form of an iFrame. This solution enables any Web3 game, launchpad, or dApp to integrate cross-chain NFT transfers with just four lines of JavaScript.

Key Benefits for Web3 Games and dApps:

- **Rapid Integration:** Developers can add full bridging functionality without deploying contracts or building UI components.
- **Cross-Chain Player Acquisition:** Games and platforms that operate on a single chain can now onboard players and assets from other chains without requiring users to leave the app interface.
- **In-Game NFT Importing:** Players can bridge their NFTs from other chains and immediately use them within the native environment of the game or dApp.
- **Increased Monetization:** Game developers can monetize bridged players without friction, generating new revenue from assets that originate outside their native ecosystem.
- **CCT Compatibility:** Since TLPT is CCT-enabled, users can also cover gas and staking fees without holding the native gas token of the chain they're bridging into.

This plug-and-play approach significantly expands the reach and usability of NFT Bridges across the entire Web3 ecosystem, allowing any app to become a multi-chain NFT portal.

COMPETITIVE COMPARISON TABLE

	NFT BRIDGES	XP NETWORK	WORMHOLE	PORTAL BRIDGE	CROSS-CHAIN BRIDGE	WORMHOLE
NFT ONLY	✓	✓	—	—	—	—
BITCOIN SUPPORT	✓	—	—	—	—	—
NON-EVM CHAINS	✓	✓	—	—	—	—
CCIP - SECURED	✓	—	—	—	—	—
TOKENIZED DAO	✓	—	—	—	—	—
BRIDGE AS IFRAME	✓	—	—	—	—	—

NFT Bridges combines best-in-class security with creator-aligned controls and multi-chain economic incentives.

HOW IT WORKS: NFT & TOKEN BRIDGING

NFT Bridges enables secure, chain-native NFT movement using a lock-and-mint protocol secured by Chainlink CCIP. Here's how the system works:

Cross-Chain NFT Transfer Flow

- 1. Initiation:** The user selects an NFT and a destination chain in the UI and pays the bridge fee in Teleport tokens (TLPT).
- 2. Verification:** The protocol verifies the NFT collection is authorized and whitelisted for cross-chain movement.
- 3. Locking:** The NFT is transferred to a Vault contract and locked. Metadata and origin chain data are logged.
- 4. CCIP Messaging:** Chainlink CCIP transmits a secure, validated message to the destination chain.
- 5. Minting:** A new NFT is minted on the destination chain with full metadata and a source chain hash.
- 6. Return Path:** If the user chooses to send the NFT back, the destination NFT is burned, and the original is unlocked.

This ensures 1:1 supply parity, traceability, and complete metadata preservation.

Cross-Chain Teleport Token Transfer (CCT)

Teleport token uses Chainlink's Cross-Chain Token (CCT) standard:

1. TLPT is **burned** on Chain A.
2. Chainlink CCIP transmits and verifies the burn request.
3. TLPT is **minted** natively on Chain B.

The result: No wrapping, no liquidity pools, and a fully native token experience on any supported chain.

USE CASES

Nadia Bridges an NFT from Astar to Soneium

Nadia is a digital artist who minted a limited edition NFT on Astar, a fast, low-cost chain without native support for CCIP. She wants to sell her NFT on Soneium, where the collector base and liquidity are much larger.

Using NFT Bridges, Nadia accesses a simple UI that supports Stellar-to-Ethereum bridging.

- 1. Locking on Astar:** She initiates the transfer. The NFT is locked in an Astar smart contract, and metadata is recorded on-chain.
- 2. Triggering Chainlink CCIP:** The Bridge messages Chainlink's CCIP, which monitors the Astar chain and detects the lock event. It verifies the transaction and relays a secure signal to Soneium.
- 3. Minting on Soneium:** On Soneium, the NFT Bridges smart contract receives the instruction and mints an equivalent NFT — with full metadata — directly to Nadia's Soneium wallet.
- 4. Marketplace Listing:** The NFT gets listed automatically on Soneium's Roundup NFT market. Nadia puts her NFT for sale, expanding her audience and potential sale price.

Later, when the buyer wants to move the NFT back to Stellar, the process works in reverse — ensuring the original NFT is unlocked and the Ethereum version burned.

This use case demonstrates how NFT Bridges will make it possible for creators on chains like Stellar to participate in Ethereum's NFT economy, without requiring wrapped tokens, centralized relayers, or trust assumptions.

USE CASES

Moving Teleport Tokens Across Chains Using CCT Pools

Jasmine is an active community member and NFT collector who earns **Teleport tokens** on **Polygon** through NFT staking rewards. However, she wants to use those tokens on **Ethereum**, where she participates in governance proposals and pays fees for high-value bridge transactions.

With Teleport upgraded to the **CCT standard**, Jasmine no longer needs to use wrapped tokens, centralized bridges, or swap platforms to move her tokens.

Here's how she does it:

1. Jasmine visits the **NFT Bridges dApp** and selects “**Move Teleport to Ethereum.**”
2. She enters the amount, confirms the destination chain (Ethereum), and signs the transaction.
3. **Chainlink's CCIP + CCT protocol** handles the transfer:
 - The CCT smart contract on Polygon burns the tokens from Jasmine's wallet.
 - The equivalent amount is **minted natively on Ethereum** and sent to her address.
 - The total supply remains consistent, secured by Chainlink's **decentralized oracle network**.
4. Jasmine sees the Teleport tokens appear in her Ethereum wallet within minutes, ready for use.

Benefits:

- No swapping, no bridging UI, no wrapped assets – just seamless token access on any supported chain.
- Jasmine can now vote on DAO proposals or pay for NFT Bridges transactions directly from Ethereum.

The experience is **fast, secure, and completely native**, powered by the **underlying CCT liquidity pool architecture**.

Jasmine

The character represents the user initiating the token transfer.

“Move Teleport Tokens” (Mobile Device)

This shows Jasmine using the NFT Bridges interface (likely a dApp) to start a cross-chain transfer of her Teleport tokens.

Polygon — Ethereum

This arrow shows Jasmine is moving her tokens from **Polygon to Ethereum**, using **CCT (Chainlink's Cross-Chain Token standard)**.

The dotted line shows **CCT handling the secure minting** on the destination chain.

Burn

This icon represents the **burning of Teleport tokens on the source chain** (Polygon). This is part of the **burn-and-mint mechanism** used by CCT to ensure the total supply remains accurate across chains.

Distribution

This symbolizes the **minting of new Teleport tokens on Ethereum** to Jasmine's wallet — a 1:1 reflection of what was burned on Polygon.

Bridge Architecture

- **Collection Registry:** Only verified, creator-approved collections can bridge
 - **Lock Vault:** NFTs are locked on the source chain
 - **CCIP Messaging:** Securely sends mint instructions to the destination chain
 - **Mint Contract:** Mints 1:1 NFT copy with origin metadata
 - **Return Path:** Burns the bridged NFT and releases the original when returning
-

Teleport Token Design (CCT-Enabled)

Teleport (\$TLPT) is a cross-chain utility token with the following roles:

- **Bridge payments:** All NFT bridges are paid in TLPT
- **Staking:** Required for validator participation and access to governance

-
- **Governance:** Token holders vote on protocol upgrades, whitelisting, fees
 - **Incentives:** Early users, node operators, and ecosystem partners earn TLPT

Teleport is launched using Chainlink's CCT standard, meaning it can be transferred natively across supported chains without wrapping or swapping. It is the first NFT-native cross-chain currency.

TOKENOMICS

Dynamic Emission Formula

NFT Bridges will implement a dynamic/smart token release mechanism aimed at stabilizing and increasing the token's market value over time. The protocol uses a **Dynamic Emission Formula** to determine how many new TLPT tokens should be released based on actual usage of the bridge and prior market behavior.

Emission Formula

$$B = R \cdot (M_{n+1} - M_n) / M_{n+1}$$

$$T_{n+1} = T_n / (1 - B)$$

$$X = T_{n+1} - T_n$$

- M_n = Dollar value of TLPT used on the bridge in the beginning of month n
- M_{n+1} = Dollar value of TLPT used on the bridge in the beginning of month $n+1$
- T_n = Tokens in circulation at the beginning of month N
- T_{n+1} = Tokens in circulation at the beginning of month $N+1$
- R = The response sensitivity coefficient
 - The response sensitivity can range from 0 to 1
 - 0 - no release/burn - no response
 - 1 - release/burn - complete response
 - B = braking factor
 - X = New tokens to be emitted in month $n+1$ to break the tokens values change.

Let's assume that in month N there are 100 tokens at a price of \$3

At the end of month N the price rose to \$3.2 and we are interested in releasing a number of tokens that will curb the increase (or decrease if the price drops - then the quantity to be burned will be calculated)

Example of calculation with a braking coefficient of 0.5

$$0.03125 = 0.5 \cdot (3.2 - 3) / 3.2$$

The quantity of tokens that should be in circulation at the beginning of the month N+1 is
 $100 / (1 - 0.03125) = 103$

Hence the New tokens to be emitted in the beginning of month n+1

$$X = 103 - 100 = 3$$

Emission Formula

$$\frac{M_{n+1}}{(T_{n+1} + X)} = V_n$$

$$X = \frac{(M_{n+1} - V_n \cdot T_{n+1})}{V_n}$$

- $M_n = 100$
- $T_n = 10000$
- $M_{n+1} = \$120$
- $T_{n+1} = 9000$ (10% were burned)
- $V_n = 100 / 10000 = .01$
- $X = (120 - 0.01 \cdot 9000) / 0.01 = 3000$

$$X = (120 - 0.01 \times 9,000) / 0.01 = 3,000$$

So, 3,000 TLPT tokens would be emitted to maintain price stability.

This dynamic model gives the DAO and protocol contributors a quantitative framework to scale token emissions alongside demand, usage, and ecosystem growth while preventing runaway inflation or uncontrolled dilution.

Dynamic Token Emission Strategy

Teleport tokens are emitted through a dynamic mechanism designed to scale sustainably with protocol usage across all CCT-supported chains. This multi-pronged model balances incentives for growth, alignment with performance, and predictable distribution over time.

- **Activity-Based Emission:** A portion of TLPT emissions is distributed to participants—validators, collections, users—based on protocol activity. As NFT transfer volume increases across chains, emissions scale proportionally.
- **Performance-Based Emission:** Allocations are also tied to specific KPIs such as marketplace adoption, active user growth, number of successful bridges, and DAO participation.
- **Time-Based Emission:** A fixed release schedule ensures consistent token availability over time, adding predictability and helping manage long-term expectations.

This structure works seamlessly with the CCT protocol: minted TLPT can be distributed directly on the chain where activity occurs, eliminating the need for bridging and reducing fragmentation. Total Supply: 1,000,000,000 TLPT

CATEGORY	ALLOCATION	PURPOSE
Presale	3%	Strategic backers and early supporters
IDO	5%	Public access to token before CEX listing
DEX + CEX Liquidity Reserve	12%	Exchange liquidity and price discovery
CCT Liquidity Pools	15%	Enable native mint/burn flows across chains
DAO Treasury	10%	Investments, grants, liquidity, and rewards
Team & Founders	18%	Long-term contributor compensation (vested)
Chainlink Node Operators	6%	CCIP, VRF, and automation infrastructure
Other Node Operators	5%	Validators and relayers outside Chainlink
Marketing & Growth	8%	Ecosystem campaigns, KOLs, adoption
Marketplace Incentives	4%	Incentives for NFT market integration
User Incentives & Airdrops	5%	Zealy quests, loyalty, onboarding
DeFi / Lending Pools	3%	Staking and Teleport-backed lending
Advisors & Legal	3%	Strategic and regulatory support
Strategic Reserve	3%	DAO-controlled for future flexibility

PROTOCOL REVENUE MODEL

NFT Bridges generates revenue through several protocol-level mechanisms:

- **Bridge Fees:** A fixed \$5 fee is charged for every NFT bridged between chains. These fees are paid in TLPT and support validators, operational sustainability, and DAO funding.
- **Marketplace Sales Fee:** A 2.5% fee is charged on every NFT sale that occurs on the destination chain following a bridge event.
- **Collection Subscriptions:** NFT collections can subscribe for \$1,000/month, covering up to 200 user NFT transfers per month. This model supports creators and simplifies onboarding.

From the \$5 bridge fee, **10% is allocated to the NFT Bridges DAO** to support long-term ecosystem development.

DAO REVENUE MODEL

The NFT Bridges DAO acts as a decentralized treasury and protocol steward. Its mission is to fund innovation, improve validator and marketplace adoption, and incentivize long-term use of the NFT Bridges network.

DAO Treasury Flywheel

- **Revenue Inflow:** 10% of every TLPT-based bridge fee is routed to the DAO treasury.
- **Governance Decisions:** Token holders vote on how capital is allocated.
- **Productive Use:** Treasury funds may be deployed in:
 - Liquidity provisioning
 - NFT lending programs
 - Ecosystem grants
 - Community and validator incentives
- **Growth Loop:** These actions stimulate new usage, driving more transactions, more TLPT demand, and more DAO income.

DAO activity is transparent and auditable, governed on-chain, and designed to align incentives between users, validators, partners, and developers. NFT Bridges generates revenue through several protocol-level mechanisms:

- **Bridge Fees:** A fixed \$5 fee is charged for every NFT bridged between chains. These fees are paid in TLPT and support validators, operational sustainability, and DAO funding.
- **Marketplace Sales Fee:** A 2.5% fee is charged on every NFT sale on the destination chain following a bridge event.
- **Collection Subscriptions:** NFT collections can subscribe for \$1,000/month, covering up to 200 user NFT transfers per month. This model supports creators and simplifies onboarding.

From the \$5 bridge fee, **10% is allocated to the NFT Bridges DAO** to support long-term ecosystem development. DAO capital is governed by community vote and may be used to:

- Fund grants and ecosystem partnerships
- Participate in lending markets or liquidity pools
- Distribute incentives to contributors or users
- Acquire assets for DAO utility or revenue

The DAO is a long-term engine for reinvestment in the NFT ecosystem, with full transparency and governance over all fund usage.

GOVERNANCE

Teleport holders stake tokens to vote on protocol-level decisions:

- Bridge fees and rewards
- Collection and chain whitelisting
- DAO treasury deployment

Governance is on-chain, with vote weight determined by the amount staked. All proposals follow a 14-day cycle and are open to any qualified token holder.

STAKING

Staking is central to protocol security and alignment:

- Stake TLPT to become a validator
- Earn fees and voting power
- Get access to exclusive whitelists and airdrops

Users can choose locked or flexible staking options. Long-term stakers earn multipliers and DAO rewards. Early withdrawals incur penalties.

CCT UTILITY BENEFITS

CCT deployment unlocks:

- Seamless token use across chains
- One-token gas payment and fee abstraction
- Interoperable staking and governance
- A clean user experience with no wrapped tokens or bridges

Teleport becomes the native token of cross-chain NFT commerce.

AMBASSADORS NFT COLLECTION

As part of our community and liquidity bootstrap, NFT Bridges launched the “Ambassadors” NFT collection — 3,000 unique art pieces inspired by the Exquisite Corpse technique.

Each NFT includes a randomized allocation of Teleport tokens, up to 100,000 TLPT, as part of a gamified mint. Users who bridge their NFTs across three or more chains will receive a free NFT from the DAO.

The collection also grants access to exclusive roles, rewards, and governance rights.

Number of Bundled TLPT	NUMBER OF NFTS	Total TLPT Distributed
100 TLPT	2,889	288,900 TLPT
1,000 TLPT	100	100,000 TLPT
10,000 TLPT	10	100,000 TLPT
100,000 TLPT	1	100,000 TLPT
Total	3,000	588,900 TLPT

Future Innovation: Bridging CCIP to Non-CCIP Chains

To expand the reach of NFT Bridges beyond the CCIP-compatible ecosystem, we are developing a new bridge architecture using Chainlink Functions. This system will allow secure NFT transfers between chains supporting Chainlink CCIP (like Ethereum or Astar) and chains not (such as Stellar).

Why It Matters

- Many NFT ecosystems exist on non-EVM or non-CCIP-enabled chains
- Existing cross-chain protocols do not support the safe movement of NFTs to these chains
- Projects and communities on these chains are currently isolated from broader liquidity

How It Works (Planned)

- A Chainlink Function reads events (e.g., NFT burn or lock) on a non-CCIP chain
- It sends a verifiable message to a CCT-enabled contract on a CCIP chain
- That contract mints or unlocks the NFT as part of a validated transaction
- The reverse process is used for return journeys

This approach ensures security, traceability, and 1:1 NFT movement across any chain, including non-EVM environments like Stellar or Stacks. It opens NFT Bridges to hundreds of new projects and chains and strengthens TLPT's value as a truly chain-agnostic asset.

ROADMAP (2025–2026)

(NOTE: Moved here after Validator Network and before Strategic Marketing Framework)

STRATEGIC MARKETING FRAMEWORK

NFT Bridges has developed a marketing strategy aligned with its multi-chain, CCT-enabled infrastructure to promote protocol adoption and long-term growth. By leveraging Teleport’s native cross-chain utility and governance model, marketing efforts are designed to drive usage and community ownership.

Core Marketing Initiatives: 17

- **Ambassador NFT Collection:** Launch and promote “The Ambassadors” NFT series to drive awareness, early adoption, and TLPT distribution.
- **Influencer Campaigns:** Collaborate with creators, KOLs, and NFT influencers across multiple chains to highlight use cases and incentivize onboarding.
- **Token Bundling for Collections:** Enable other NFT projects to bundle TLPT with their own launches across chains, leveraging the CCT format to avoid liquidity fragmentation.
- **Community Engagement Programs:** Run gamified events, quests (via Zealy or similar), and multi-chain activations to encourage recurring user activity.
- **Strategic Collaborations:** Partner with marketplaces, launchpads, and L1/L2 chains to make TLPT the native payment token for NFT transactions.
- **Exchange Listings:** Coordinate listings on centralized and decentralized exchanges that support CCT-compatible tokens.
- **Subscription Promotions:** Offer launch support and onboarding incentives to projects using the NFT Bridges subscription model.

These marketing efforts will focus on elevating NFT Bridges as the infrastructure leader for cross-chain NFT movement — powered by a scalable, secure token economy.

VALIDATOR NETWORK AND DECENTRALIZATION

The NFT Bridge Network of Transaction Validators (NBNTV) is a secure, decentralized layer for validating NFT transfers across chains.

Key Components

- **Validators:** Independent operators selected via staking, earning fees from validation services.
- **Consensus:** Combines Proof-of-Stake (PoS) and Practical Byzantine Fault Tolerance (PBFT) for resilient, fast agreement.
- **Smart Contracts:** Lock/mint/burn logic deployed on all supported blockchains.
- **Governance Module:** DAO structure allows token holders to guide protocol upgrades and validator policies.

Implementation Roadmap

- **Phase 1:** Technical planning and target chain selection
- **Phase 2:** Smart contract and node software development
- **Phase 3:** Community testnet for validator testing and refinement
- **Phase 4:** Mainnet validator launch with staking and validator selection
- **Phase 5:** DAO-based governance and community voting
- **Phase 6:** Network expansion and partnership integrations

Security Model

- **No Central Points of Failure:** Attacks must target multiple validators, increasing cost and difficulty
- **Staking Collateral:** Required to participate, deterring Sybil attacks
- **Auditable Transactions:** All validator actions are logged on-chain
- **DAO Oversight:** Community participation ensures continuous evolution and transparency

FAQ

Why do people use your product? Why does it need a token?

NFT Bridges is a cross-chain asset bridge that allows you to move your NFTs from one blockchain to another. The token is a mechanism that makes using the bridge easier, safer, and more straightforward, and it's the grease that makes the engine go smoother and faster.

What is a token used for?

Teleport serves as a utility token within the community and facilitates participation in governance. However, it is not used for trading goods publicly, discharging debt, representing shareholding, participation rights, or any form of ownership or interest in the company.

How does the token improve your product?

Our token enhances our product by minimizing the need for intermediaries in transaction settlements, reducing costs, improving liquidity, enabling real-time settlements, granting access to protocol-specific services, and offering discounted fees for utilizing NFT Bridges services compared to using other tokens.

The token is used to incentivize the validators network, which decentralizes bridge operations and safeguards all bridge transactions. The token has already been accepted as a means of payment in the Soneium NFT market. It can be used in similar ways in other chains and NFT markets. Making it more central in the NFT economy.

Why does the token have value for the holders?

Through staking, holders can generate additional revenue, benefit from subscription discounts, and enjoy reduced bridge fees. Holders can actively safeguard the bridge and earn additional tokens by participating in the validators network.

What are the networks that NFT Bridges support?

At this point, the bridges are between Ethereum, Stacks, Bitcoin, Solana, Polygon, Base, BSC, Astar, Soneium, and Flow.

What wallets are supported by the project?

Hiro wallet, phantom wallet, and whatever wallet-connect are supporting on the Ethereum side.

What is the transfer duration from the source network to the destination network?

It depends on the networks. We use the CCIP protocol to secure the NFT movement between chains. CCIP blocks can sometimes take twenty minutes to be created and signed. When moving an NFT to Bitcoin and creating an ordinal, users usually wait between ten and twenty minutes for the inscription and the block to be signed. The Stacks main net creates blocks every minute or so, so these transactions are relatively quick.

How many transactions are needed to facilitate a transfer?

Two transactions are needed to facilitate a transfer. One is to lock the original NFT in the vault, and the other is to mint the NFT on the new chain.

Can a user without value in the destination network use this?

You can use Teleport tokens and the bridge will handle the transaction fees on both chains.

Can we use NFT Bridges to transfer a billion \$ value NFT?

Yes, we can.

APPENDIX

Smart Contract Repositories

Contract Type	Contract Type	Link / Location
NFT Lock Vaults (EVM)	Deployed/Testnet	https://github.com/kofif1/nft-bridges-contracts
CCT Teleport Token Pools	In Progress	Private repo – will be made public on launch
Chainlink VRF Integration	Complete	Included in Ambassadors NFT mint contract
Chainlink Functions POC	In Progress	Stellar-EVM prototype (Kickstart grant recipient)

Protocol Components & Roles

Component	Role
Teleport Token (CCT)	Powers fees, staking, governance, cross-chain operations
DAO Treasury	Controls protocol revenue, grants, lending, and incentive strategies
Chainlink CCIP	Secures NFT and token bridging with decentralized messaging
Chainlink VRF	Verifies random NFT rewards (e.g., Ambassadors drop)
Chainlink Functions	Enables bridging between CCIP and non-CCIP chains
Verified Collection Registry	On-chain access control for bridge eligibility

Strategic Partners

- **Chainlink** – Infrastructure partner for CCIP, CCT, VRF, and Functions
- **Soneium Blockchain** – First integrated NFT market accepting Teleport
- **Astar Network** – Launch partner for Astar Degens testnet
- **Bitcoin Frontier Fund** – Early investor and accelerator
- **Stellar Development Foundation** – POC grant provider for Stellar-EVM bridge
- **Beamit.AI** – AI-driven Web3 gaming launchpad
